# compact MDM

The compact MDM (cMDM) makes it possible for small repackers, pharmacies and hospitals to check multi- and unit dose pouches fast and secure. The compact MDM can detect and recognize the content of each pouch and saves the results in a special database.

Two Tablet Packing Machines can be connected to one compact MDM and all software for programming drugs and the server are integrated into the machine.

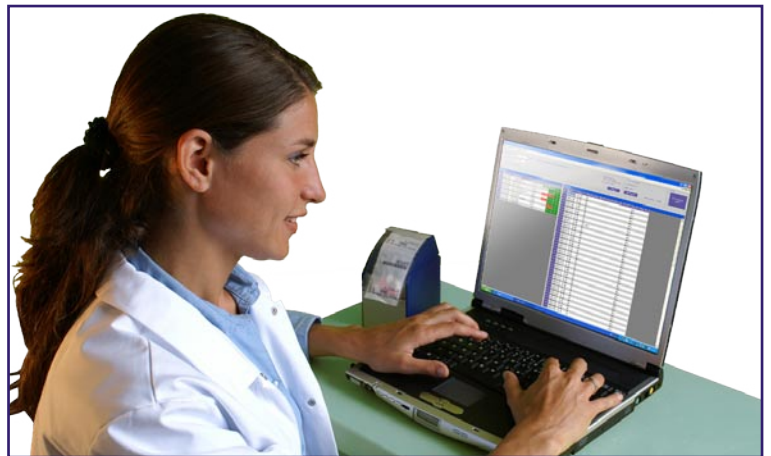

## Checking pouches

The compact MDM machine checks the content of each pouch by recognizing and counting the pills. The real content of the pouch is compared with the expected. Also a picture of the pouch is taken for reference. All data will be transferred to the database of the cMDM.

## Viewing results

The rejected pouches are visible in the Check out production software. All checked pouches can be viewed and the rejected ones are flagged. The pharmacist locates the fault by viewing the pouch and indicates the fault for statistic and proof reasons.

## Distributing pouches

After the rejected pouches are repaired the patient pouch rolls are placed in medicine dispensers and can finally be distributed to the patients.
